

## CSCI354 Assignment 2

### Part A

Write a function that changes the data-image-url of a random otter thumbnail when the webpage is loaded, so that the detail image no longer matches the thumbnail. Use the URL of an image of your choosing (though a web search for “cute cat” should provide a good one). Below shows an illustration, where the forth thumbnail has been randomly changed:

**Hint:** You may refer to MDN for the built-in Math object to generate random number.

### Part B

Now extend Part A by each time the randomly chosen thumbnail has been clicked, resetting all your otter thumbnails to their original data-image-url values and then changing another one at random.
